

# DISCLOSURE

**Cross-Border Stablecoin Register (CBSR)** Maintainer: Yunjie Fan, independent research on cross-jurisdictional digital-asset regulation Status: v0.1.0 · June 2026 · a standing disclosure for the register, its derived layers, and the companion working papers Companion documents: [CHARTER.md](#) · [GOVERNANCE.md](#) · [METHODOLOGY.md](#)

---

## 0. Purpose and scope

This is the project's standing disclosure. It applies to the register, to every derived layer built on it, and to the companion working papers in the portfolio (the Compliance Matrix, the Architecture working paper, the Corridor Atlas, and the forward-feasibility and methodology papers). Each working paper also carries its own short disclosure; this document is the full, standing version those short disclosures point to, elevated to a repository document so that a reader of any artifact in the portfolio can find the complete statement in one place.

Where [CHARTER.md](#) states the project's commitments and [GOVERNANCE.md](#) states how those commitments are kept as structure, this document states the independence, conflict-of-interest, and limitations position as a disclosure a reader, a citing author, a journal, or a supervisor can rely on.

---

## 1. Independence

This is independent research. **No compensation (direct, contingent, or otherwise) has been received** for the register, the companion working papers, or any underlying research in the portfolio. **No advisory, consulting, employment, or other compensated relationship exists** with any party having a financial interest in the regulatory outcomes the work analyzes: no issuer, exchange, custodian, payment provider, law firm, investor, jurisdiction, or other interested party. The work is not commissioned, not sponsored, and not produced in the service of any party's interest in how the matters it describes are regulated or resolved.

This statement is the standing form of the disclosure that appears on each working paper, and it is the disclosure the project's independence rests on. The companion documents make it operational: the charter states it as a commitment (independence is not for sale), and the governance states it as a structural firewall (the open data flows out; commercial and other interests do not flow in).

## 2. Sources

The register and the papers draw **exclusively on public sources**: enacted statutes; published or proposed regulations; agency releases, orders, and guidance; central-bank publications; public corporate disclosures; and published academic and practitioner literature. Every empirical claim is sourced to publicly accessible material, cited with a pinpoint, and (for any claim presented as citable current law) verified by a human against the primary instrument (see [METHODOLOGY.md](#)).

**No non-public information is used or disclosed.** The work describes no confidential transaction, no private arrangement, and no party's non-public commercial plans. Where it analyzes how a configuration would compose under the constraints of the law, the analysis is generic and derived from the public regulatory record; it is not a description of any actual party's confidential structure.

### 3. Not legal advice

The register and the papers are a **structured reference, not legal advice**. Using them, citing them, or contributing to them creates **no solicitor–client or attorney–client relationship** and no advisory relationship of any kind. The work describes the constraint structure of the law as it stands and as it is pending; it does not advise any reader on a course of action. A reader with a live legal question must verify every relevant claim against the primary sources and obtain advice from a qualified professional in the relevant jurisdiction. Nothing in the reference is a representation that any described arrangement is lawful, available, or advisable in any particular case.

### 4. Conflict-of-interest policy

The project’s conflict-of-interest policy is the firewall, stated here as a standing rule.

- **Commercial reuse is permitted and expected.** The register’s data is openly licensed (CC-BY-4.0) and may be reused for any purpose, including commercially. This is intentional: the data is most useful when it is most freely usable.
- **Reuse creates no relationship.** A party’s reuse of the open data (however extensive, and whether or not commercial) creates no relationship with the maintainer, confers no influence over the register’s content or its verification priorities, and is not an endorsement of that party or its use by the project. Attribution may not be presented in a way that suggests the project endorses the user or the use (a standing condition of the licence).
- **Interests never flow back into the data.** There are no sponsored records, no paid placement, no pay-to-verify, and no arrangement under which a financial interest could shape what the register says or which cells are verified first. The boundary is one-directional: data out, interests not in.
- **A standing commitment to disclose.** If the maintainer were at any point to enter a compensated relationship (advisory, consulting, employment, or otherwise) touching the matters the work analyzes, that relationship would be disclosed here, the affected work would be flagged, and the independence represented above would be qualified accordingly at that time. As of this version, no such relationship exists, and this paragraph is a forward commitment, not a present qualification.

### 5. Limitations and known residuals

The project publishes its limitations as part of the record rather than leaving them to be discovered. The following are the standing residuals as of this version; each is tracked in queryable form.

- **Unverified legal cells.** A subset of propositions-of-law records have been confirmed at the level of a regime’s status, or transcribed from a reliable secondary account, but **not yet confirmed against the official text**, and are therefore held below the citable-as-current-law tier and excluded from the citable subset. They are tracked in the verification queue and the per-cell worklist (which records, for each, the instrument, the pinpoint, and exactly what is missing). The honest reading of any coverage figure is that it includes such records, visibly marked, and that **only a primary-source verification pass retires this liability**: the project’s enforcement gates are defenses against misuse, not a substitute for reading the instrument.
- **The computed layer is a preview.** The derived feasibility conclusions are labelled previews, not asserted truth; where a computed conclusion diverges from the hand-authored analysis, the divergence is published as a finding and the project does not warrant either side. Every derived conclusion rests on a **hand-curated signal table** and the cells beneath it; verification narrows, but has not eliminated, that dependency.
- **Original-language verification gaps.** For jurisdictions whose instruments are not in the maintainer’s primary working languages, verification has in places reached the regime-status level but **not yet an original-language official-text line-read**; those records are held

below the highest provenance tier and the gap is declared. A reader relying on such a cell as primary authority should consult the original-language instrument directly.

- **Forward and conditional items are conditioned, not predicted.** Every forward-looking conclusion (a pending enactment, a regime adopted but not yet operative, an open methodology not yet finalized) is presented as a conditional if-then with its conditional-status flag preserved, and is **never a prediction** of whether or when the development will occur. The project takes no position on the resolution of any contingent development, and any procedural-stage or prediction-market figure it cites is reported as the state of the public record, not as the maintainer's estimate.
- **Coverage is bounded and depth-first.** The register covers a focused set of jurisdictions and dimensions in verified depth rather than a broad set shallowly; the absence of a jurisdiction or a dimension is a scope boundary, not a judgment that the absent matter is unimportant.

## 6. Correction policy

The project welcomes correction. A reader who identifies a citation error, a factual misstatement, an improperly-qualified forward claim, or a record whose evidence axes do not match its sourcing is invited to flag it, via the register's issue tracker or the SSRN abstract page of the relevant paper. Corrections are **versioned and credited**: a substantive correction is recorded in the changelog with its rationale, the affected records or text are updated in a tagged release, and the contributor is acknowledged. Because each release is archived for a persistent identifier, the corrected version is itself citable, and the record of what changed and why is part of the published history.

## 7. Identifiers

- **Author / maintainer:** Yunjie Fan, independent researcher, cross-jurisdictional digital-asset regulation.
- **ORCID:** 0009-0005-6762-084X
- **SSRN Author ID:** 11463068
- **Register DOI:** 10.5281/zenodo.20730358 (cite the DOI of the version used; each tagged release is archived for its own version DOI).
- **Name and identifier policy:** the project is named **Cross-Border Stablecoin Register (CBSR)** everywhere it is named to a reader; where a stable URL or identifier is involved, the legacy repository slug is retained deliberately so that inbound references, the archival identifier, and the published schema identifier stay stable. The citable anchor is the DOI, not a domain.
- **Licences:** data under CC-BY-4.0; code and tooling under Apache-2.0.
